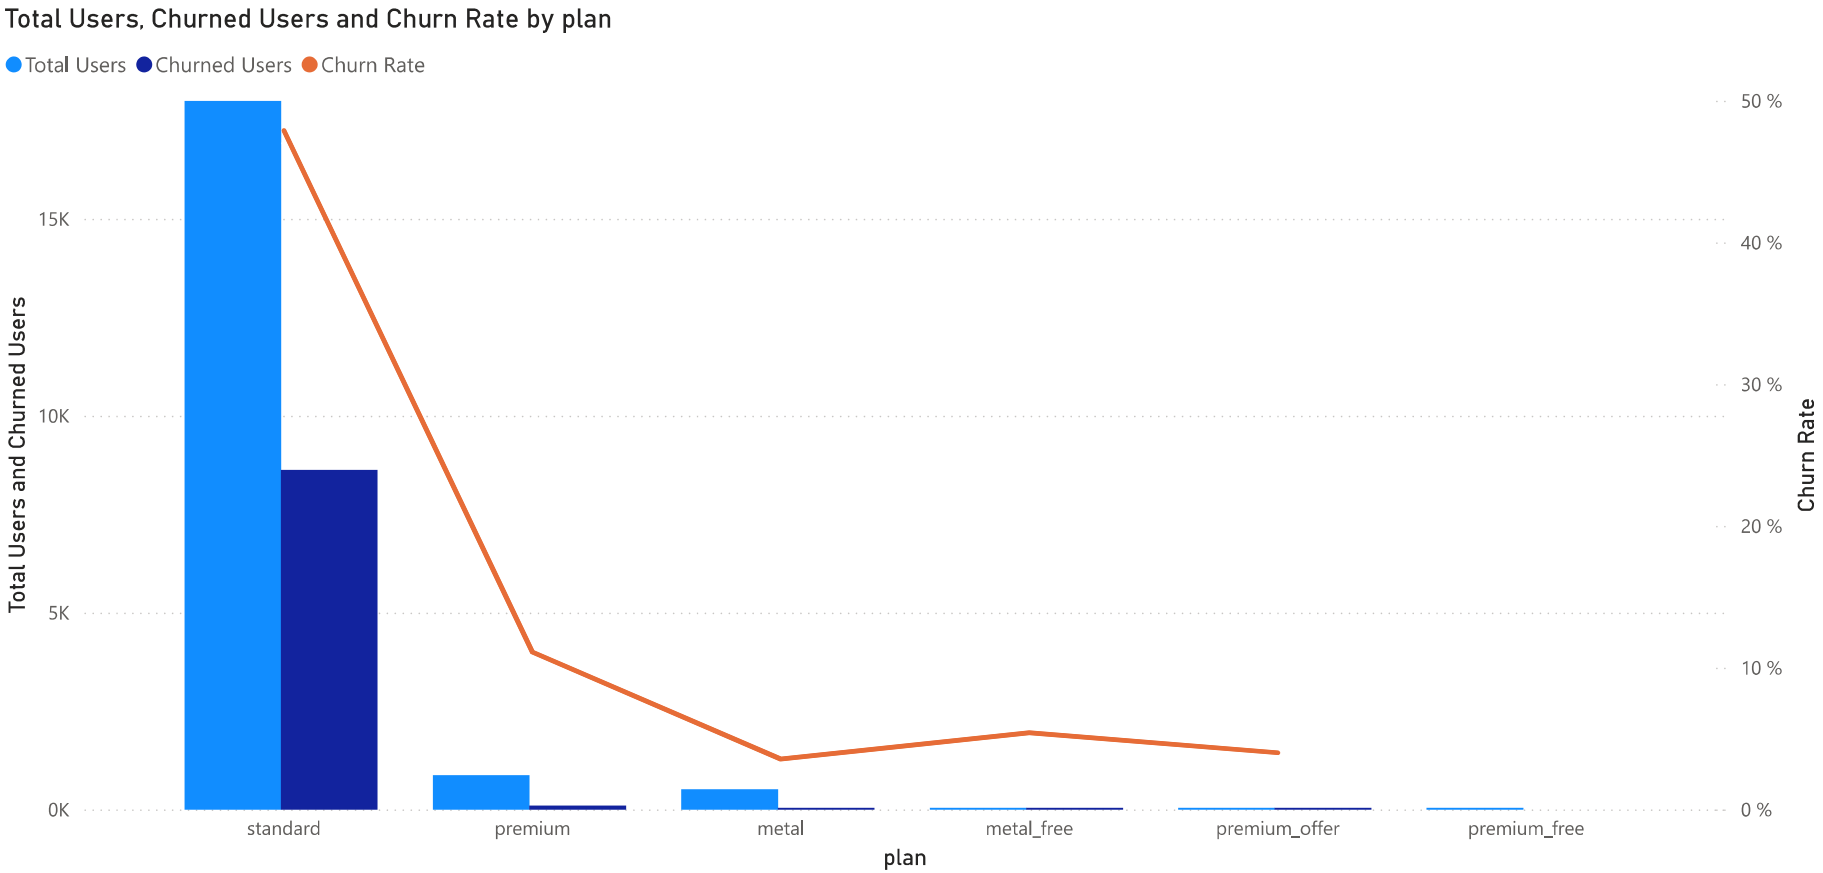
Plan Performance Overview

Where is the churn coming from?

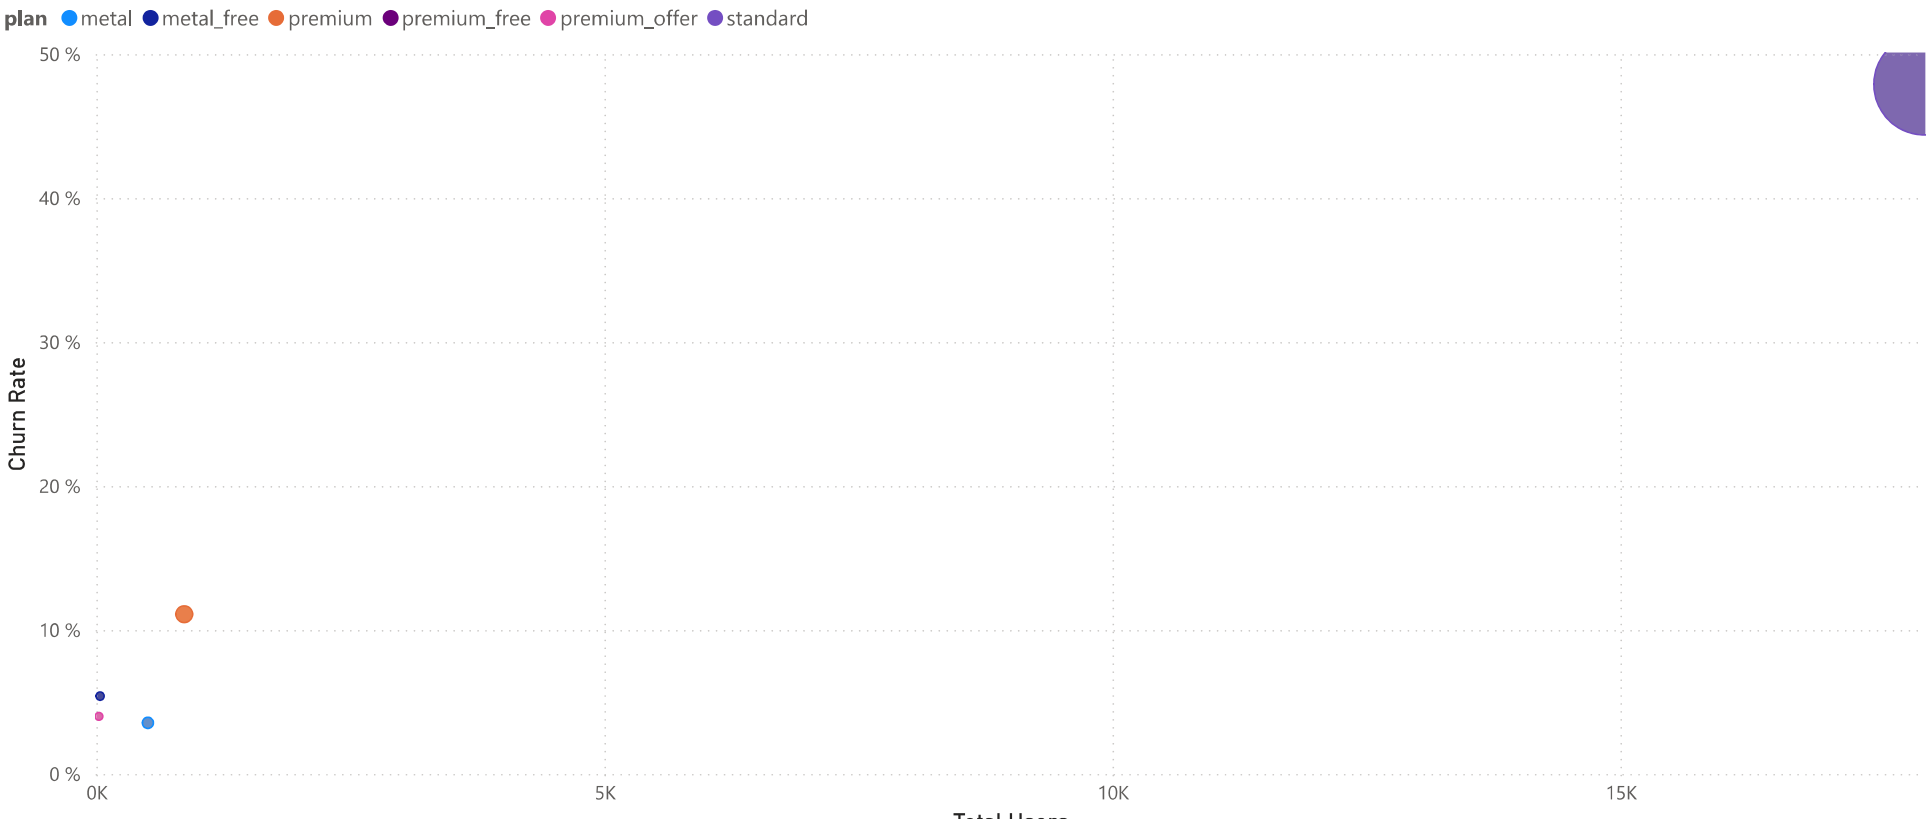


Standard users are the primary source of churn, combining high population size with the lowest recent activity levels.

Plan Risk Assessment

Which plan is the biggest risk?

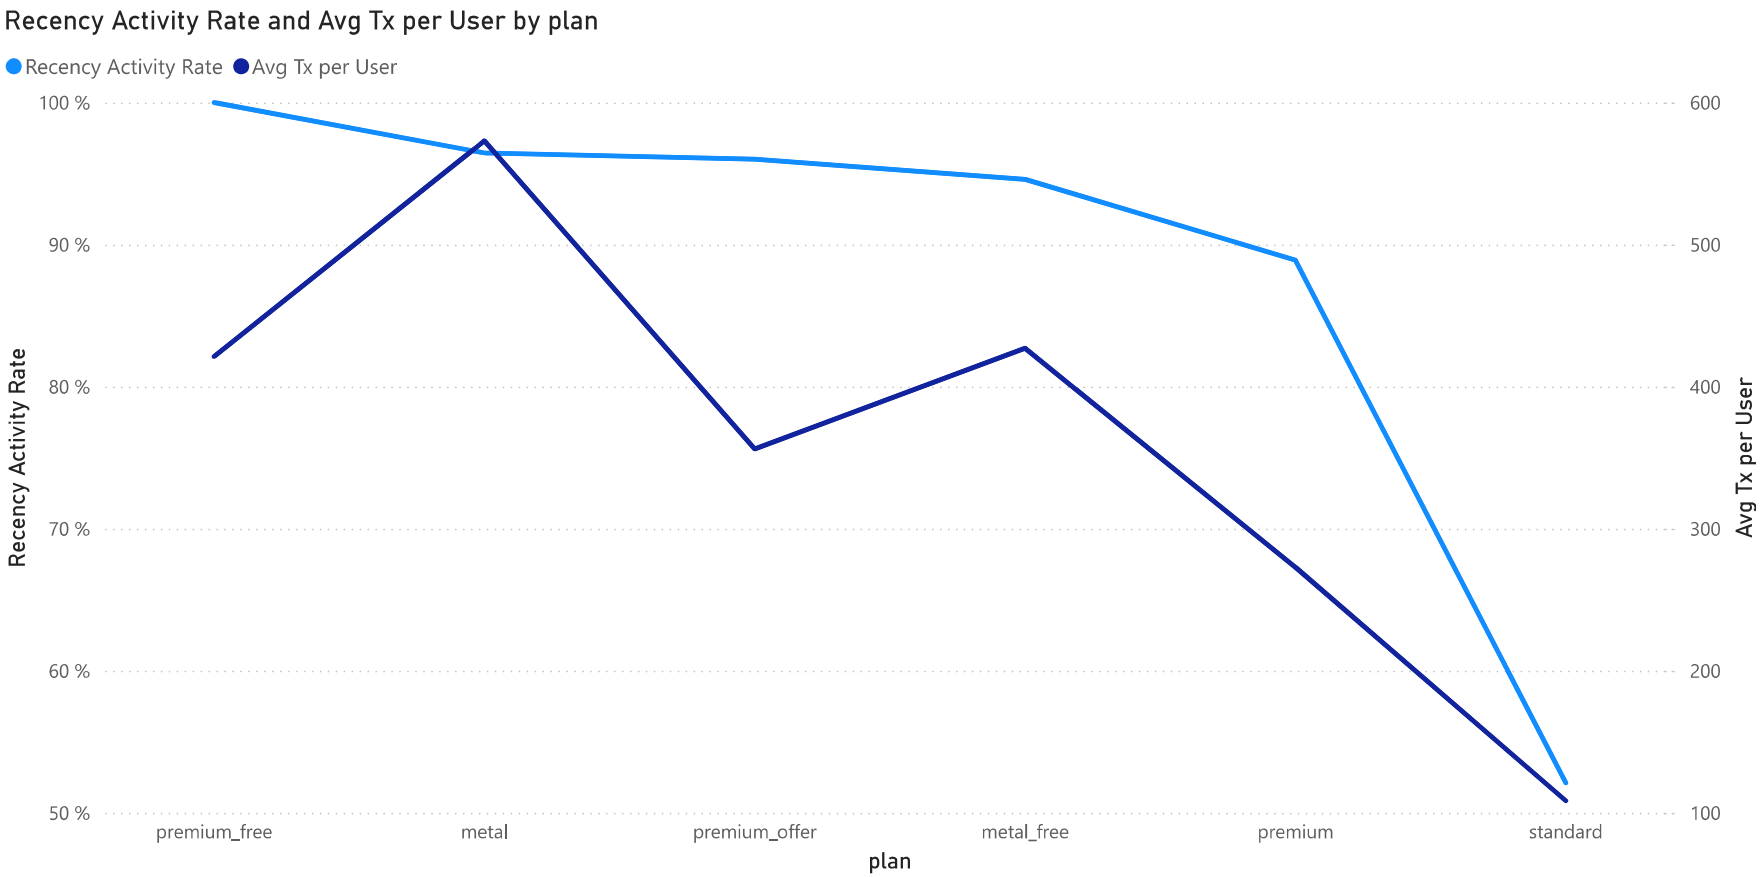
Plan Risk vs Impact



Retention efforts should prioritize Standard users, as even small improvements in this segment would have the largest impact on reducing total churn.

Engagement Intensity by Plan

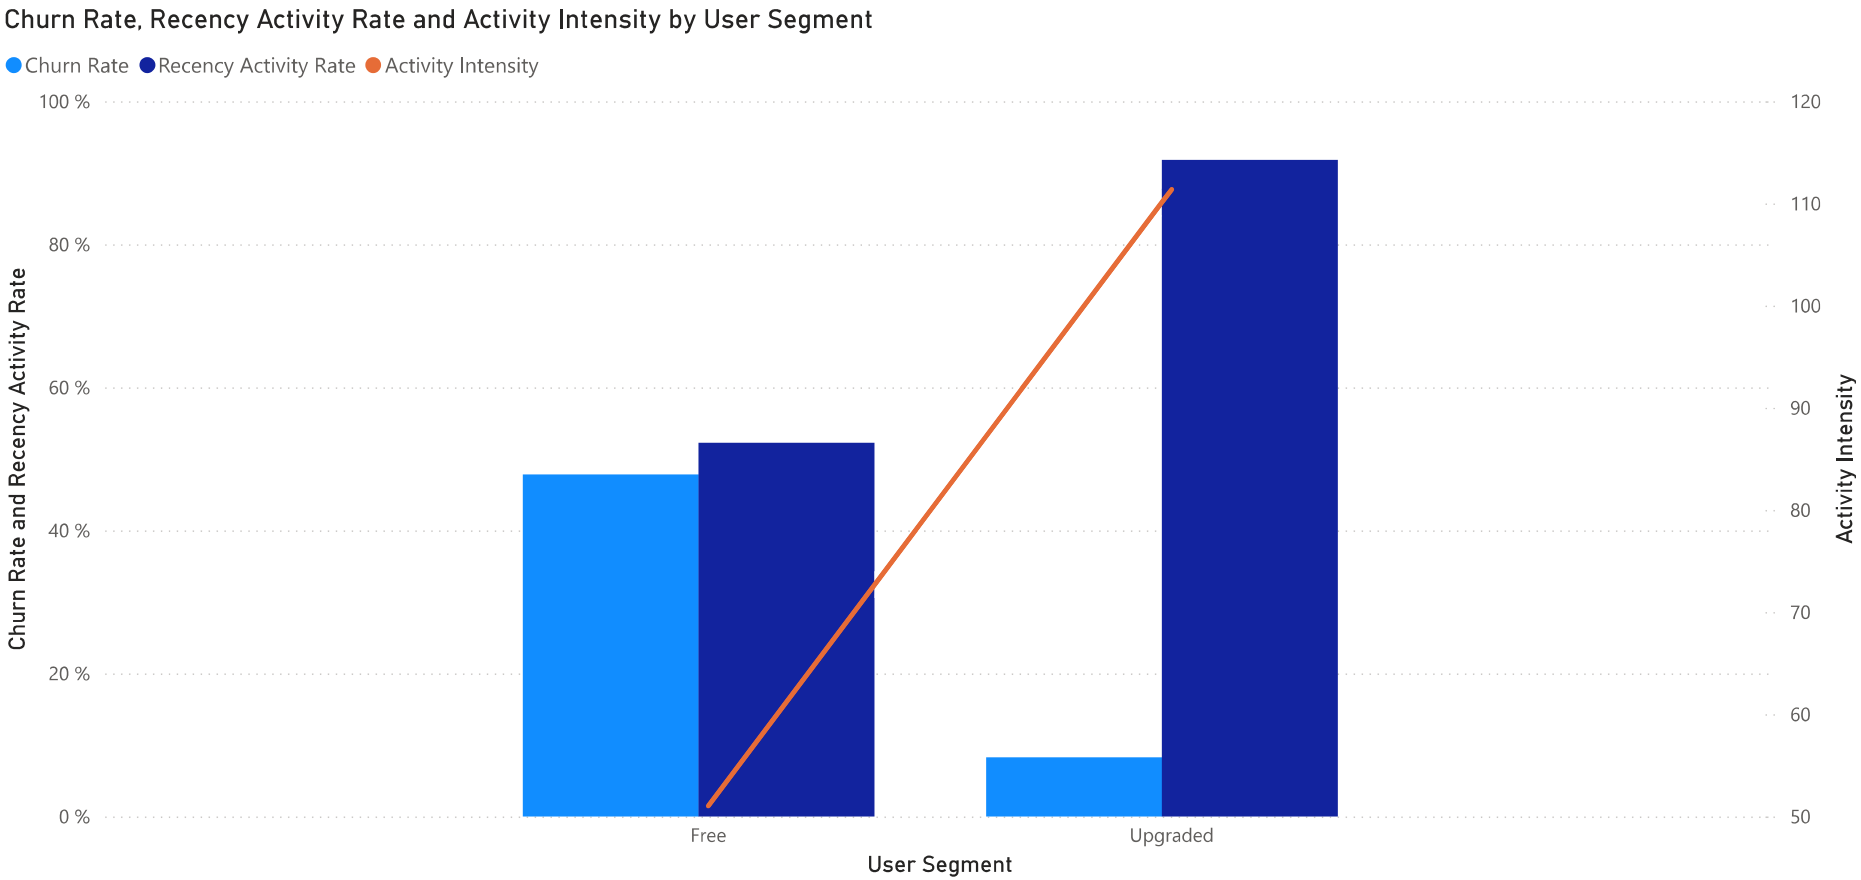
Why do some plans churn more?



Lower engagement intensity is strongly associated with higher churn across plans.

Upgrade Effect on Retention

Does upgrading change behavior?

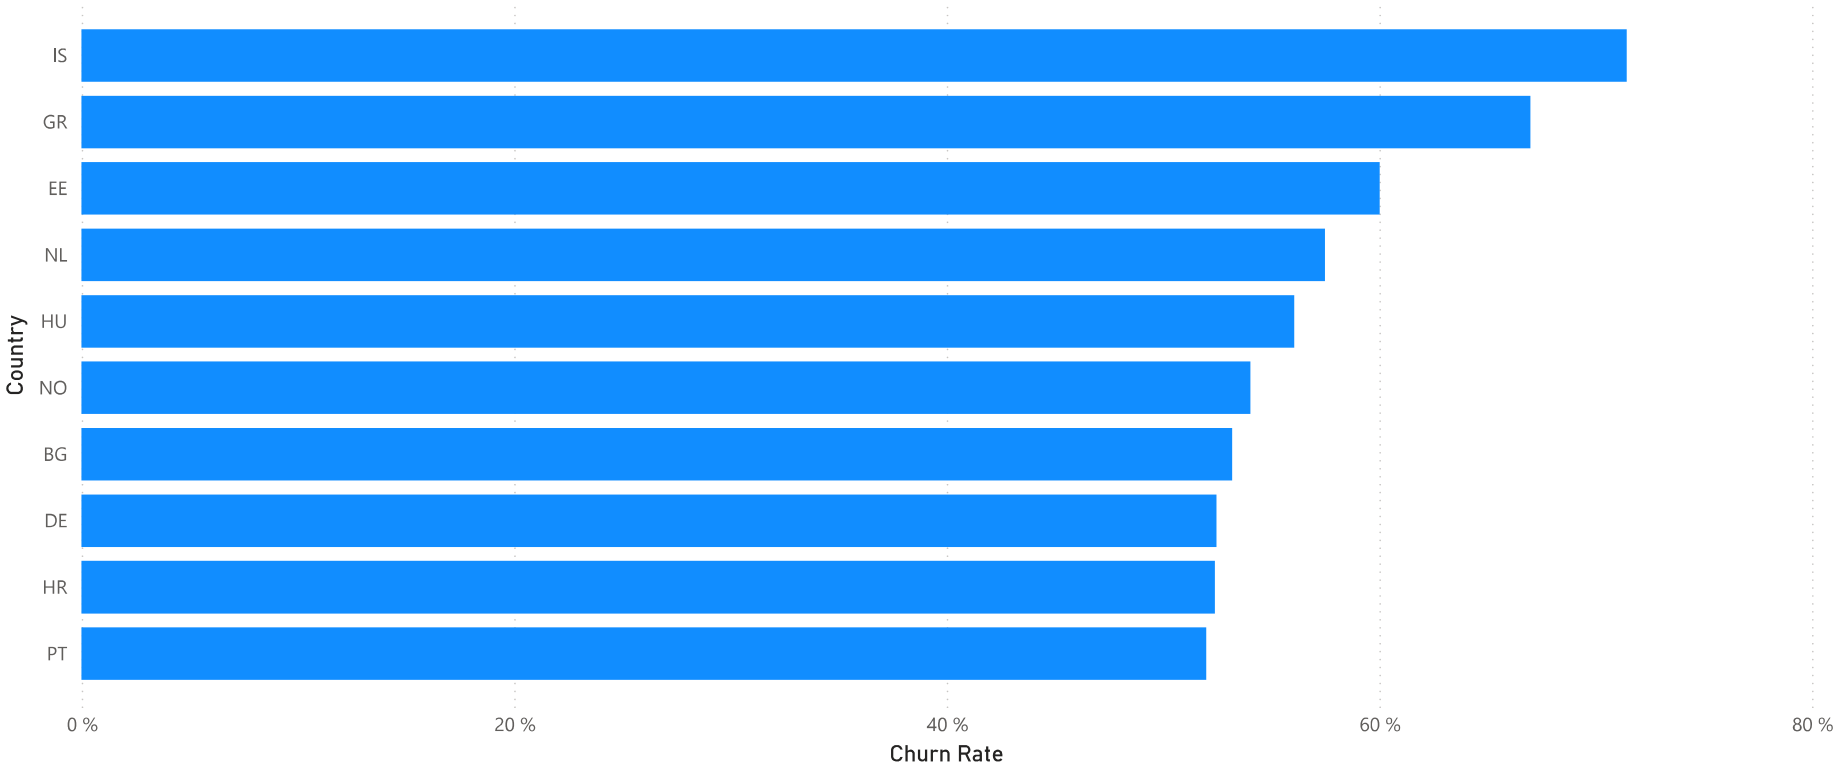


Upgraded users are significantly more active and engaged, which strongly correlates with lower churn risk.

Geographic churn risk

Where do users churn the most across countries?

Churn Rate by Country (Top 10)

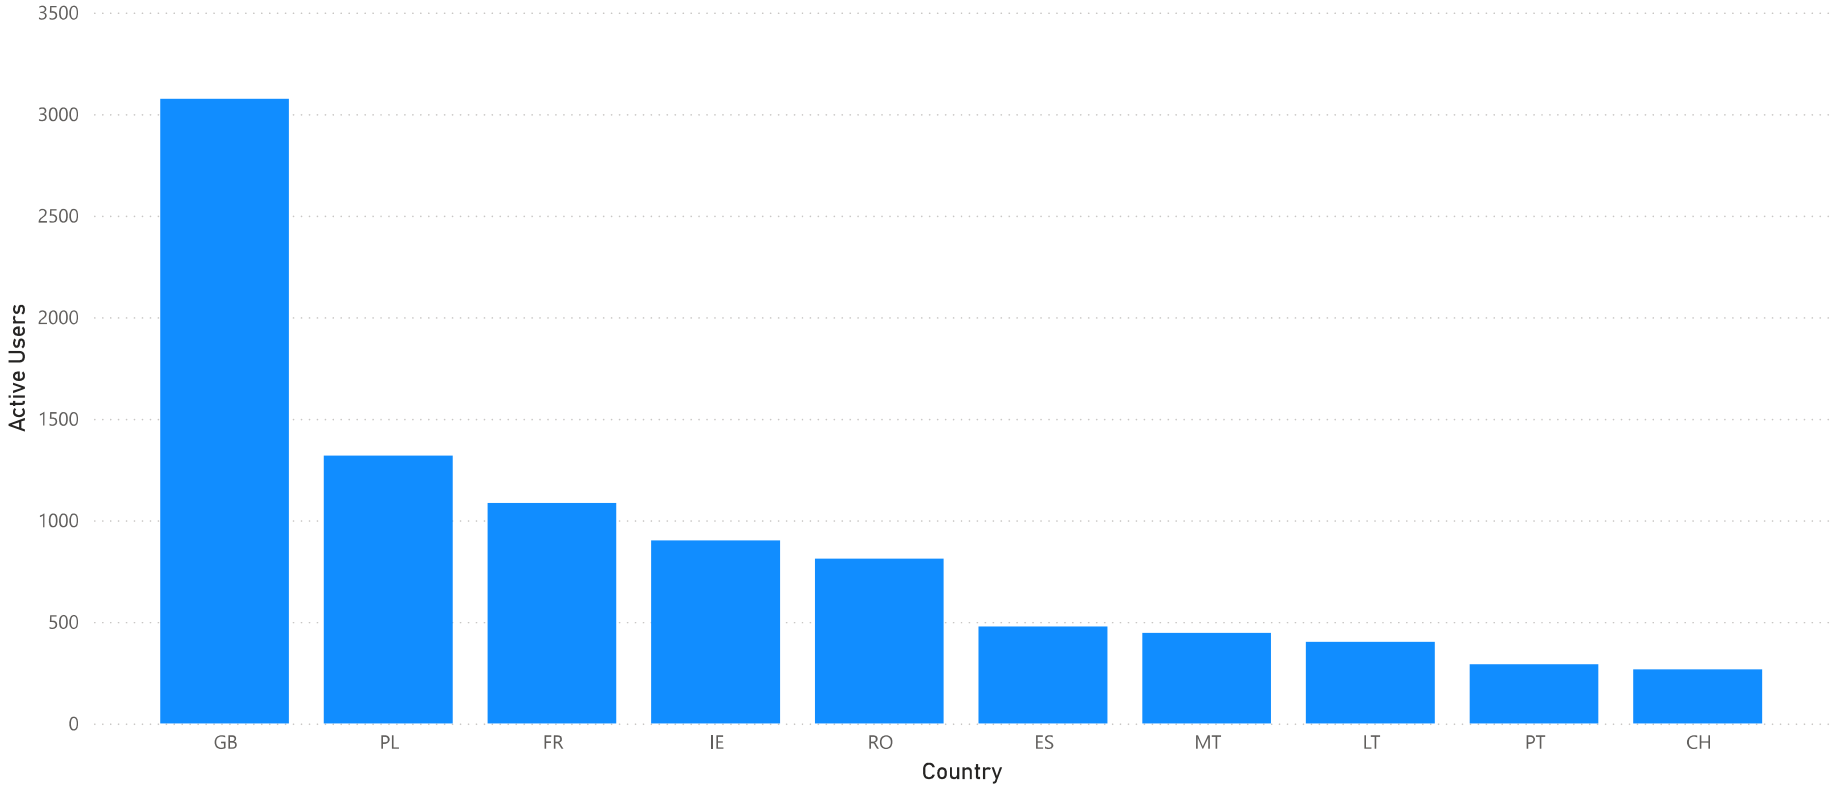


Churn rates vary significantly across countries. Iceland, Greece and Estonia show the highest churn levels, suggesting lower engagement in these markets.

Market size

Which countries represent the largest share of active users?

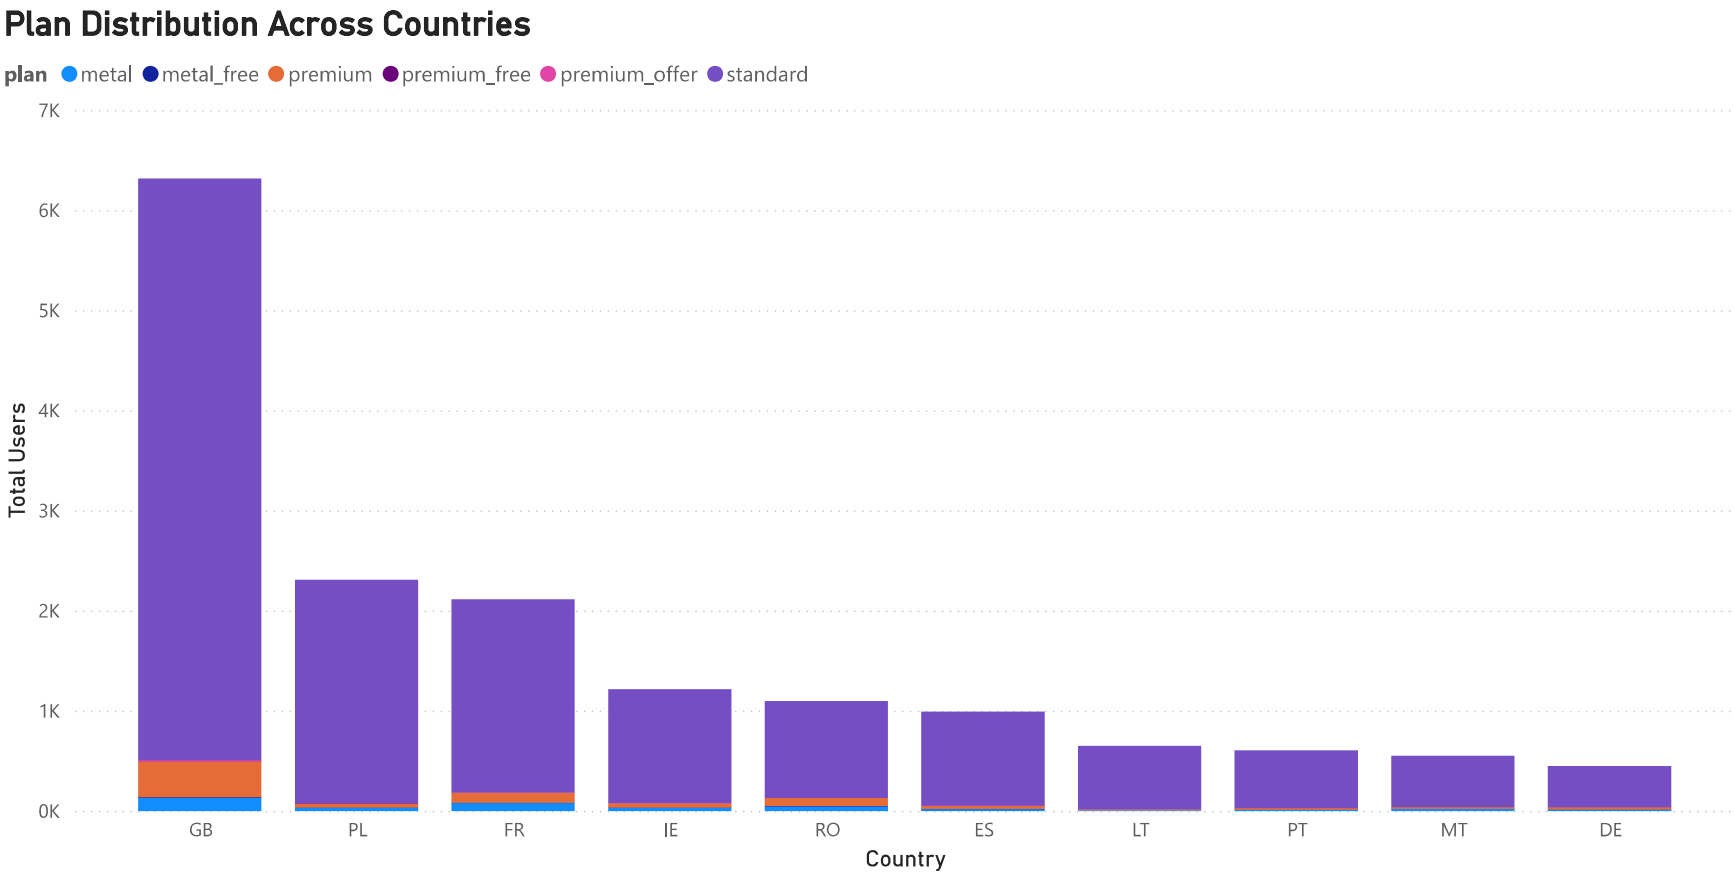
Active Users Distribution by Country



User activity is highly concentrated in a few markets. The United Kingdom alone represents the largest share of active users.

Market structure

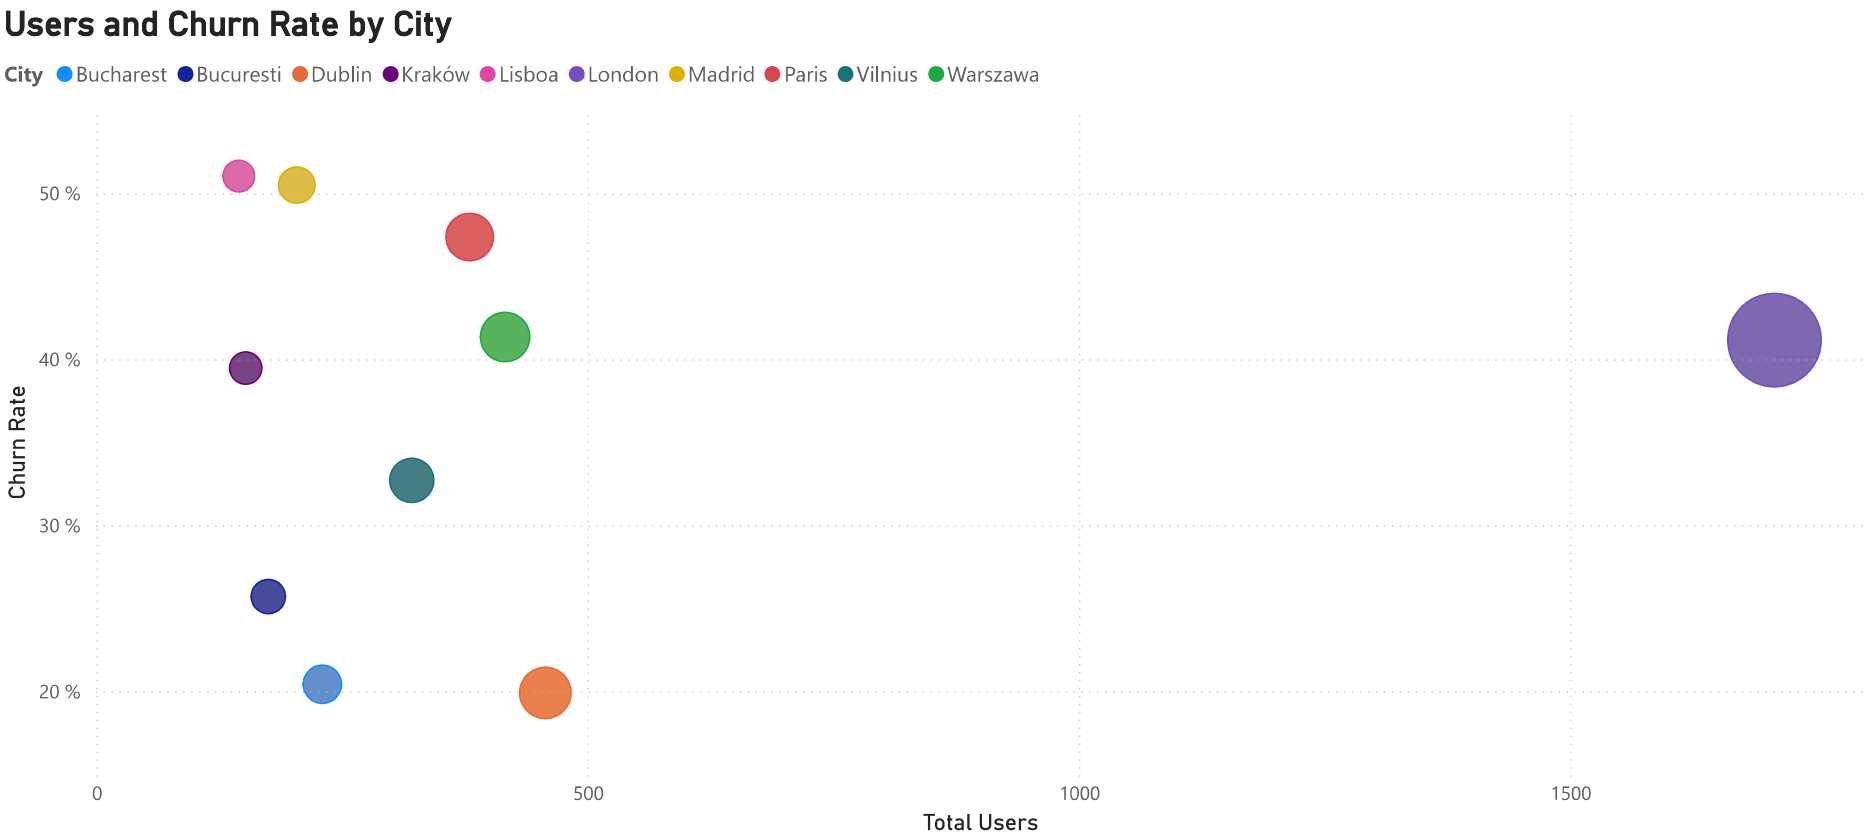
How does plan distribution vary across countries?



The Standard plan dominates across all countries, while other plans represent only a small portion of the user base.

City level patterns

Which cities combine high user volume and high churn risk?



Major cities concentrate the majority of users, but churn rates vary significantly between urban markets, suggesting differences in local engagement patterns.

Key Insight

Churn is driven more by low engagement than by plan type.

Upgraded users are more active and show much lower churn risk.

Because of its size, the Standard segment represents the largest structural churn driver — meaning that even small engagement improvements in this group could generate the greatest overall reduction in churn.

Geographic differences reveal important variations in user engagement.

Large markets such as the United Kingdom represent the greatest opportunity for retention improvements due to their significant user base.
